Amendments to the Specification

Please replace the paragraph beginning on page 32, line 14 with the following new paragraph:

In operation 902, the client apparatuses are adapted to be coupled to a host computer via a network, as set forth hereinabove. In operation 904, the identifier of the event which is stored in the memory of the client apparatuses is then retrieved utilizing the network. Such identifier is subsequently compared with an identifier of a scheduled event, as set forth in operation 906. If the comparison renders a match, the playback of the event is begun on the appropriate client apparatuses. ~~Note operation 908.~~

Please replace the paragraph beginning on page 10, line 3 with the following new paragraph:

Figures 1-19 illustrate a system for synchronizing an event on a plurality of client apparatuses. Prior to use, an event is stored in memory on at least one of the client apparatuses. Such client apparatuses are adapted to be connected to a network 135 along with a host computer(s). In operation, information is transmitted from the hose computer to the at least on client apparatus utilizing the network 135. This information allows for the simultaneous and synchronous playback of the event on each of the client apparatuses.
